Tables:

USER_ACCOUNT: This table manages essential account information and system access. It allows the players to log in and provides a separation between authentication data and in-game profile data.

PLAYER_PROFILE: This table stores profile information for each user. It records interim data, such as display name and avatar, allowing the system to manage player identity independently of their account email.

WALLET: This table manages the different types of i-game currencies for each player. It allows the tracking of the user economy.

CARD_MASTER: This table defines the master catalog of all available cards, including their rarity and expansion set. it ensures that techincar card info is not duplicated, allowing both inventories and decks to get consistent data.

POKEMON_DETAILS/TRAINER_DETAILS: These tables act as extensions of the master card table for specific card types. They store unique values (such as HP for Pokémon or object types for Trainers).

PLAYER_INVENTORY: This table tracks each player's personal card collection. It stores the quantity of copies owned and their aesthetic variants, which is fundamental for the TCG progression and personalization.

DECK: This table stores info about the custom decks created by players. Each deck is associated with a player and a specific format, allowing for individual strategy implementation.

DECK_COMPOSITION: This table serves as an intermediate table representing the relationship between decks and master cards. It allows a deck to contain multiple cards and a card to appear in several decks.

MATCH_HISTORY: this table stores general information about each game played, including data like the date, duration, and game mode.

MATCH_RESULT: This table connects players and their decks to a specific battle session. It captures individual performance data, such as the final result and the number of rewards collected.
